# $\pi-\pi$ interactions in the supramolecular structure of (4,7-dimethyl1,10 phenanthroline)(triphenylphosphine) tetrahydridoboratocopper(I) 

Ján Moncol ${ }^{\text {a }}$, Klaudia Jomováb, Michael Lawson ${ }^{\text {a }}$, Marianna Karsayováb ${ }^{\text {b }}$<br>${ }^{a}$ Faculty of Chemical and Food Technology, Slovak Technical University, Radlinského 9, SK-812 37, Bratislava, Slovakia,<br>${ }^{b}$ Department of Chemistry, Faculty of Natural Sciences, Constantine The Philosopher University, SK-949 74 Nitra, Slovakia<br>jan.moncol@stuba.sk

#### Abstract

The title compound, $\left[\mathrm{Cu}\left(\mathrm{C}_{12} \mathrm{H}_{12} \mathrm{~N}_{2}\right)\left(\mathrm{C}_{18} \mathrm{H}_{15} \mathrm{P}\right)\left(\mathrm{BH}_{4}\right)\right]$, crystallizes with two molecules in the asymmetric unit. Each $\mathrm{Cu}^{+}$ion is pentacoordinated by 4.7-dimethyl-1,10-phenanthroline, triphenylphosphine and tetrahydroborate anions in $\eta^{2}$-coordination mode. A $\pi-\pi$ stacking interaction is observed between the aromatic rings of adjacent 4,7-dimethyl-1,10 phenanthroline ligands.

Keywords: copper(I), X-ray, phenanthroline, weak interactions

## Introduction

Transition metal tetrahydrato complexes are known to play an important role in syntheses and catalysis, but also they represent a very interesting topic in structure and bonding of coordination chemistry (Marks \& Kolb, 1977). In many tetrahydroborato complexes, the $\mathrm{BH}_{4}{ }^{-}$ ligand is usually coordinated to metal atoms in $\eta^{1}-, \eta^{2}$ - or $\eta^{3}$ - coordination mode ( $\mathrm{Xu} \& \mathrm{Lin}$, 1996; Besora \& Agusti, 2008).

## Experimental

## Synthesis

$\left[\mathrm{Cu}\left(\mathrm{PPh}_{3}\right)_{2}\left(\mathrm{BH}_{4}\right)\right]$ was prepared by the procedure reported by (Moncol et al., 2005).
$\left[\mathrm{Cu}\left(\mathrm{C}_{12} \mathrm{H}_{12} \mathrm{~N}_{2}\right)\left(\mathrm{C}_{18} \mathrm{H}_{15} \mathrm{P}\right)\left(\mathrm{BH}_{4}\right)\right]$ was prepared by a modification of the procedure reported by (Green et al., 1984), by adding 4,7-dimethyl-1,10-phenanthroline ( $0.21 \mathrm{~g}, 1 \mathrm{mmol}$ ) dissolved
in methylene chloride ( 5 mL ) with a methylene chloride solution $(10 \mathrm{~mL})$ of $\left[\mathrm{Cu}\left(\mathrm{PPh}_{3}\right)_{2}\left(\mathrm{BH}_{4}\right)\right](0.60 \mathrm{~g}, 1 \mathrm{mmol})$ in dry-box.

## X-ray Crystallography

Crystal data and conditions of data collection and refinement are reported in Table 1. Data collection and cell refinement were carried out using diffractometer Bruker SMART APEXII

CCD (Bruker, 2008) at 200 K with graphite monochromated Mo $\mathrm{K} \alpha$ radiation. The semiempirical absorption corrections were applied the using multi-scan method. The structures were solved by direct methods using SIR-97 (Altomare et al., 1999) and refined by the fullmatrix least-squares procedure with SHELXL-97 (Sheldrick, 2008). Geometrical analyses were performed with SHELXL-97. The structures were drawn with XP in SHELXTL (Sheldrick, 2008) and MERCURY (Macrae et al., 2006).

Table 2. Selected geometric parameters ( $\AA$ ).

| $\mathrm{Cu} 1-\mathrm{N} 2$ | $2.129(2)$ | $\mathrm{Cu} 2-\mathrm{N} 4$ | $2.096(2)$ |
| :--- | :--- | :--- | :--- |
| $\mathrm{Cu} 1-\mathrm{N} 1$ | $2.151(2)$ | $\mathrm{Cu} 2-\mathrm{N} 3$ | $2.125(2)$ |
| $\mathrm{Cu} 1-\mathrm{P} 1$ | $2.2191(7)$ | $\mathrm{Cu} 2-\mathrm{P} 2$ | $2.1964(7)$ |

| $\mathrm{Cu} 1-\mathrm{H} 6 \mathrm{~B}$ | 2.03 | $\mathrm{Cu} 2-\mathrm{H} 4 \mathrm{~B}$ | 1.86 |

## Results and discussion

Compound (I), $\left[\mathrm{Cu}\left(\mathrm{C}_{12} \mathrm{H}_{12} \mathrm{~N}_{2}\right)\left(\mathrm{C}_{18} \mathrm{H}_{15} \mathrm{P}\right)\left(\mathrm{BH}_{4}\right)\right]$, crystallizes in a centrosymmetric space group, the asymmetric unit containing two independent molecules (Fig. 1 (molecule A) and 2 (molecule B), Table 2). The $\mathrm{Cu}^{+}$ion is five coordinate for both molecules. For both molecules, unidentate triphenylphosphine $[\mathrm{Cu} 1-\mathrm{P} 1=2.2191(7) \AA(\mathrm{A}) ; \mathrm{Cu} 2-\mathrm{P} 2=2.1964(7) \AA$ (B)], bidentate 4.7-dimethyl-1,10-phenanthroline $[\mathrm{Cu} 1-\mathrm{N} 1=2.151(2) \AA$ and $\mathrm{Cu} 1-\mathrm{N} 2=$ 2.129(2) Å for molecule A; Cu2-N3 =2.125(2) $\AA$ and Cu2-N4 $=2.096(2) \AA$ for molecule B] and unsymmetrical bidentate $\mathrm{BH}_{4}{ }^{-}[\mathrm{Cu} 1-\mathrm{H} 5 \mathrm{~B}=1.68 \AA$ and $\mathrm{Cu} 1-\mathrm{H} 6 \mathrm{~B}=2.03 \AA$ for molecule $\mathrm{A} ; \mathrm{Cu} 2-\mathrm{H} 1 \mathrm{~B}=1.82 \AA$ and $\mathrm{Cu} 2-\mathrm{H} 2 \mathrm{~B}=1.86 \AA$ for molecule B$]$ completes the copper(I) coordination, but there are subtle differences between the two complex molecules. The $\tau$ parameters (Addison et al., 1984) are 0.34 for molecule A and 0.20 for molecule B, respectively.

Fig. 1. Perspective view of the complex containing Cu1, showing the atom labeling scheme. Thermal ellipsoids are drawn at the 30\% probability level.

Fig. 2. The $\pi-\pi$ stacking interactions in crystal structure of $\mathbf{I}$.

The distances between Cu and B atoms in molecule A and B are 2.286(2) $\AA$ and 2.307(2) $\AA$, respectively. The molecular structure of both molecules of $\mathbf{I}$ are very similar with molecular structure of $\alpha$ and $\beta$ forms of $\left[\mathrm{Cu}\left(\mathrm{PPh}_{3}\right)\left(1,10\right.\right.$-phenanthroline) $\left.\left(\mathrm{BH}_{4}\right)\right]$ (Green et al., 1984; Green et al., 1981) as well as $\left[\mathrm{Cu}\left(\mathrm{P}(\mathrm{OEt})_{3}\right)(1,10\right.$-phenanthroline $\left.)\left(\mathrm{BH}_{4}\right)\right]$ (Makhaev et al., 1993). On the other hand, the copper atom is only four-coordinated in $[\mathrm{Cu}(2,9$-dimethyl-4,7-diphenyl-1,10-phenanthroline) $\left.\left(\mathrm{BH}_{4}\right)\right]$ (Green et al., 1984; Moncol et al., 2006) and $[\mathrm{Cu}(2,9-$ dimethyl-1,10-phenanthroline) $\left(\mathrm{BH}_{4}\right)$ ] (Green et al., 1980). The additional interactions between molecules of $\mathbf{I}$ are $\pi$ - $\pi$ stacking interactions (Fig. 2) (Janiak, 2000) between the symmetry-related adjacent phenanthroline rings of molecule B (atoms N3/N4/C33-C44) (-x + $2,-y+1,-z$ ) [distances between the planes of phenanthroline rings is $3.47 \AA$ ].
